

ABOUT US

THE SURREY VEIN CLINIC

The Surrey Vein Clinic specialises in the treatment of varicose veins, spider veins and thread veins. As well as treatments, we offer impartial advice and information on a range of vascular conditions and ailments including facial thread veins, facial spider veins and varicose veins in pregnancy. We also treat hyperhidrosis (severe sweating).

The Clinic is a private organisation and we pride ourselves on meeting the requirements of our patients.

We are a team of Consultant Vascular Surgeons and Radiologists, Nurse Practitioners and General Practitioners with capable and experienced office support concerned about your health. Flair and experience provide an excellent standard of medical care.

The clinics cover Surrey, Hampshire, Berkshire, West Sussex and Middlesex.

FOR THE TREATMENT OF
FLARE VEINS, FACIAL BLEMISHES
AND VARICOSE VEINS

www.surreyveinclinic.co.uk

COMMON CONDITIONS

FLARE VEINS

These are tiny surface veins. They may appear blue, red, or pale green.

Treatment Options

Sclerotherapy Injections

FACIAL BLEMISHES

These can be red or blue surface veins usually on cheeks or nose.

Treatment Options

Sclerotherapy Injections

VARICOSE VEINS

Large rope-like veins, that can grow in size over time. Left untreated, Varicose Veins can result in severe pain and complications.

Treatment Options:

- Varicose Vein Removal
- Endovenous Laser Ablation
- Microwave treatment
- Foam Sclerotherapy

HYPERHIDROSIS

Excess sweating which can be generalised but usually affects the armpits (axillae), hands, feet and head.

Treatment Options

- Botox injections
- Thorascopic sympathectomy surgery

TREATMENT

SCLEROTHERAPY

Sclerotherapy injections - Used commonly for spider veins and small varicose veins, Sclerotherapy involves injecting 0.2% fibroven liquid through a very fine needle into the affected vein or area. Sclerotherapy can be quickly performed at our clinic and no anaesthesia is required.

Foam sclerotherapy - An alternative form of sclerotherapy available for the treatment of small varicose veins.

ENDOVENOUS LASER ABLATION

The use of lasers is the preferred alternative to surgical stripping to treat varicose veins. In endovenous laser therapy, the patient usually only needs a local anaesthetic. Endovenous laser therapy can be performed in a clinic or surgery in 1 - 2 hours and the patient is encouraged to walk immediately following the procedure.

VARICOSE VEIN REMOVAL

Surgical stripping is done in an operating theatre under general anaesthesia and is a surgical procedure to remove the damaged veins to prevent further deterioration and discomfort. As this is a surgical procedure there is usually a recovery period of several days needed after this treatment.

VNUS

VNUS is a method of treating veins from the inside in a similar way to laser treatment. Like laser therapy, it is most frequently performed under anaesthetic as a day case.

BOTOX INJECTIONS / THOROSCOPIC SYMPATHECTOMY SURGERY FOR HYPERHIDROSIS

Hyperhidrosis can be treated with injections of Botox which can be performed in an outpatient treatment room. Treatments usually last for 6-12 months and can easily be repeated. We offer treatment for armpits, forehead/scalp and hands/palms/feet.

CONSULTATION PRICES

Consultation (flare/facial veins): **From £90.00**
Consultation (varicose veins): **From £150.00**
Consultation (varicose veins + scan): **From £270.00**
First Consultation + injection: **From £150.00**

TREATMENT PRICES

Sclerotherapy injections: **From £140.00**
Varicose Vein removal: **From £750.00**
(Under local anaesthetic)
Endovenous laser ablation: **From £1,500.00**
VNUS radiofrequency ablation: **From £1,500.00**
Hyperhidrosis Treatment: **From £330.00**
